Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-i- MISCELANEOUS: A cysteine residue is required for ubiquitin-
thiolester formation.
-i- SIMILARITY: Contains 1 C2 domain.
-i- SIMILARITY: Contains 1 HECT-type E3 ubiquitin-protein ligase
                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: Involved in the embryonic development and differentiation of the central nervous system.

PATHWAY: Ubiquitin conjugation; third step.
SUBUNIT: Binds SCNNIA, SCNNIB and SCNNIG (By similarity). STRECELLULAR LOCATION: CYCOPlasmic.
TISSUE SPECIFICITY: Brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY: Contains 3 WW domains. CAUTION: Ref.3 sequence differs from that shown due to a frameshift in position 12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MGD; MGI:97297; Nedd4.

Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.

Disclosure; Page 13; 75pp; English.

The present sequence is the WW domain of a HECT (homologous to E6 carboxyl terminus) B3 ubiquitin ligase. The WW domain binds to the Smad Py motif, resulting in ubiquitinalion of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad Py motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein

(I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and
                             bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating troken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
ubiquitin ligase activity. The method is useful for stimulating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for modulation of viral maturation. The invention also provides an isolated protein complex comprising a HECT-RCC1 selected from HETT-WW, HECT-RCC1, Gag protein, Gag late domain, P13, actin, myosin, HSp60, HSp70, HSp90, STAM1, STAM2A, STAM2B, VMS-UIM, GTPase, E2 enzyme, tsg101, cullin, HERC1, HERC2, HERC3, Nedd4 -11ke protein or clathrin. The complexes, proteins, antibodies and methods are useful for treating viral infections, such as lymphosarcome, human immunodeficiency virus (HIV), hepatitis, poliomyelitis, measles, or Ebola and for inhibiting budding in a subject. They are also useful in diagnostic assays for determining whether a cell is infected with a virus and for characterising the nature, progression and/or infectivity of the infection. The invention is also useful in protein therapy. The present sequence is human NEDD4 protein used to illustrate the method of the
               activities, or as an immunogen to generate antibodies. This is the amino acid sequence of WW binding protein Ned4 WW domain.
                                                                                                                                                                                                                                                                                                                                                                                                                     Viral infection; lymphosarcoma; human immunodeficiency virus; hepatitis; poliomyelitis; HIV; measles; protein therapy; human; NEDD4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New protein complex comprising HECT-RCC1, viral maturation scaffolding protein (VMSP), and/or HIV gag protein, useful for treating viral infections, such lymphosarcoma, HIV, hepatitis, poliomyelitis, measles, or BDola.
                                                                                                                                   Gaps

                    as
defective or impaired beta-catenin function and/or MBCAT function such cancer, or angiogenic, apoptotic or cell proliferation disorders. Proteins that interact with MBCAT are also useful in detecting and providing information about the function of MBCAT proteins. The present sequence represents a human NBDP4 (neural precursor cell expressed developmentally downregulated 4) protein, identified as an MBCAT polypeptide in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel assay identifying an inhibitor of ubiquitin-mediated proteolysis of a IkappaB polypeptide. The method comprises: (a) providing a ubiquitin-conjugating system including the

The invention relates to a method for modulation of viral maturation. The invention also provides an isolated protein complex comprising a HECT-RCC1 selected from HETT-WW, HECT-RCC1, Gag protein, Gag late domain, Pl3, actin, myosin, HSp60, HSp70, HSp90, STAM1, STAM2A, STAM2B, VMS-UIM, GTPBSe, E2 enzyme, tsg101, cullin, HERC1, HERC2, HERC3, Nedd4 -like protein or clathrin. The complexes, proteins, antibodies and methods are useful for treating viral infections, such as lymphosarcoma, human immunodeficiency virus (HIV), hepatitis, poliomyelitis, messles, or Ebola and for inhibiting budding in a subject. They are also useful in diagnostic assays for determining whether a cell is infected with a virus and for characterising the nature, progression and/or infectivity of the infection is also useful in protein therapy. The present sequence is human NEDD4 protein used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, PDZ domain, WW domain, rat, cow, mouse, fruitfly, protein therapy, gene therapy, PDZ-mediated disease, inward potassium channel, WBP; dimer inhibitor peptide, carboxylate binding loop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Methods for identifying polypeptides comprising PDZ domains, the polypeptides and their encoding nucleic acids, useful for the diagnosis and treatment of PDZ related disorders.
                                                                                                                                                               New protein complex comprising HECT-RCC1, viral maturation scaffolding protein (VMSP), and/or HIV gag protein, useful for treating viral infections, such lymphosarcoma, HIV, hepatitis, poliomyelitis, measles, or Bbola.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                        ò
                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 681, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the
                   The invention relates to methods for identifying polypeptides comprising PDZ domains, and their encoding nucleic acids. The sequences are used to identify modulators of their expression, function and activity, for use in the diagnosis and treatment of PDZ related disorders. Antibodies against the proteins and cells that produce them may be used for the treatment of PDZ-mediated disease states. Sequences AANBT843-AANB7974 represent proteins containing PDZ domains, fragments of these proteins and other related peptides used in the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                           WW domain; drug candidate screening; drug discovery; drug modification;

The WWP4 gene was identified and isolated from a cDNA expression library generated from LNCap prostate cancer cell line, using peptides AAW38063-64. These peptide recognition units are based on the sequences of WW domain binding domains of the alpha and gamma subunits of epithelial sodium channel protein. The WW domain is a small functional domain found in a large
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide recognition unit, YAP WW domain binding protein, WBP-1; WBP-2; WW domain; cell signalling; growth regulation; cytoskeleton organisation; targeted drug screening; modulator; WW domain interaction; WWP4.
recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate antibodies. This is the amino acid sequence of novel human WW binding protein WWP4-2 WW domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying cell signalling and growth regulatory polypeptides by reaction with multivalent recognition complex - polypeptides are useful in targetted drug selection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         'note= "the nucleotides encoding these amino acids are

(I) is useful for screening a potential drug candidate, by allowing (I) to come into
                                                                     Ĭ
number of proteins from a variety of species including humans, nematodes and yeast. Its name is derived from the observation that two tryptophan residues, one in the anno terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most proteins containing WW domains have a function involving cell signalling and growth regulation or the organisation of the cytoskeleton. Polypeptides containing a WW domain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domain ser used for targeted drug screening, i.e. to identify potential modulators of specific WW domain interactions. The valency of the recognition unit is important in form and the containing specificity of interaction with WW domain and the containing specificity of interaction with WW domain and the containing specificity of interaction with WW domains and the containing specificity of interaction with WW domains and the containing specificity of interaction with WW domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug discovery; drug modification; binding protein 4; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel purified polypeptide comprising WW domain, useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                      form specificity is relaxed, but not lost, so proteins containing WW domains similar, but not identical, to the sequence of the peptides' target WW can be detected, including new polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Pub polypeptides can be produced in transfected host cells. They can control the steady state level of cd25 phosphatese, the degree of CDK kinase (e.g. cdc2) dephosphorylation and the steady state level of p53 (controlling the degree of cell cycle regulation of p53). They can regulate cell or tissue differentiation, or cell growth or proliferation by affecting other proteins, can be a specific (ant)agonist of wild-type protein function and may be used as immunogens to elicit a specific
           for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of the arctifing when brought into contact with one another in the absence of the drug candidate, and determining the effect, if any of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate antibodies. This is the amino acid sequence of a novel human WW binding protein WWP4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human and Saccharomyces pombe protein ubiquitin ligase(s) - involved in cdc25 phosphatase and p53 ubiquitination, and regulate cell growth and

                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not forma part of the printed specification, but was obtained in electronic formate directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

compound libraries to discover novel therapeutics to regulate kidney function, as an antigen to raise polyclonal or monoclonal antibodies, and as a therapeutic agent or target. Agents that modulate, up-or-down-regulate the expression of [11] or agents that agonise or antagonise the activity of the protein are useful to modulate biological and pathologic damage or end-stage renal disease (ESRD). This is the amino acid sequence of the diseased kidney associated novel human protein #2, described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expressed in diseased kidney tissue compared to normal kidney tissue. (1) and its encoded protein (II) are useful for diagnosing a renal disease state e.g. IgA nephropathy (IgAN) which presents as asymptomatic microscopic haematuria and/or proteinuria or episodic gross haematuria, necrotising crescentic glomerulonephritis (NCGN), minimal change disease (Min Ch) or renal hypertrophy (the cause of end-stage renal disease and early manifestation of diabetes), in a subject. (II) is useful; as a target for identifying agents which modulate the expression or activity of (I), for identifying binding partners, as novel target for screening synthetic small molecules and combinatorial or naturally occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel human genes that are differentially expressed in renal biopsy samples from patients with kidney diseases useful for diagnosing renal diseases such as IgA nephropathy or necrotizing crescentic glomerulonephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated nucleic acid molecule (I) that is

Prostate cancer marker protein.

04-DEC-2003

ADB75453 standard; protein; 854 AA.

```
The present sequence is the protein sequence of human CGDD-3, a novel protein associated with cell growth, differentiation and death. The sequence is predicted from Incyte clone 366046CB1, which was isolated from a brain tumour tissue cell line cDNA library. Structural features establish the protein as being associated with cell growth, differentiation and death, with further evidence suggesting it to be a differentiatin protein ligase. The invention is based on novel human CGDD-1 to 21 proteins (see ABD58330-50), the polymucleotides encoding them (see ABZ4689-709), and to the use of these for the diagnosis, treatment or prevention of cell proliferative disorders including cancer, developmental disorders, neurological disorders, autoimmune disorders, reproductive disorders, and disorders of the placenta, and in the expression of proteins and nucleic acids associated with cell growth, and companies and mit cell growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 JK, Batra S, Baughn MR, Becha SD;

The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal control non-prostate cancer in the patient sample and the normal sevel indicates that the patient is afflicted with prostate cancer.

Nucleic acacca, and may be useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB75611 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4, Ap
